Here when we called the callme() present in another
function actually called but after calling it,get
removed , as a result of that the execution context of
this callme() is also remove where all the values and
variable are present.

here is a question that
callme() is a child function
of function and for it, which
context will be refered by
"this"?

answer--> this will refer to global context.

if have access of Window then global will refer to it.
if have access of node enviornment then it iwll give
an empty object.{}

and this is for callme() present in the written
function.

context of targeted function.

another function

another function

Global execution context

function(){
callme():
}

if here is a function and one more callme() is
present in it.
